# Guidewise

Brand rules that run. Guidewise checks marketing content against a team's own approved rules and dated facts before it is published. Every finding quotes the rule it breaks and the exact words, every fix is re-tested before it is offered, risky content goes to the right reviewer, and a person makes the final approval.

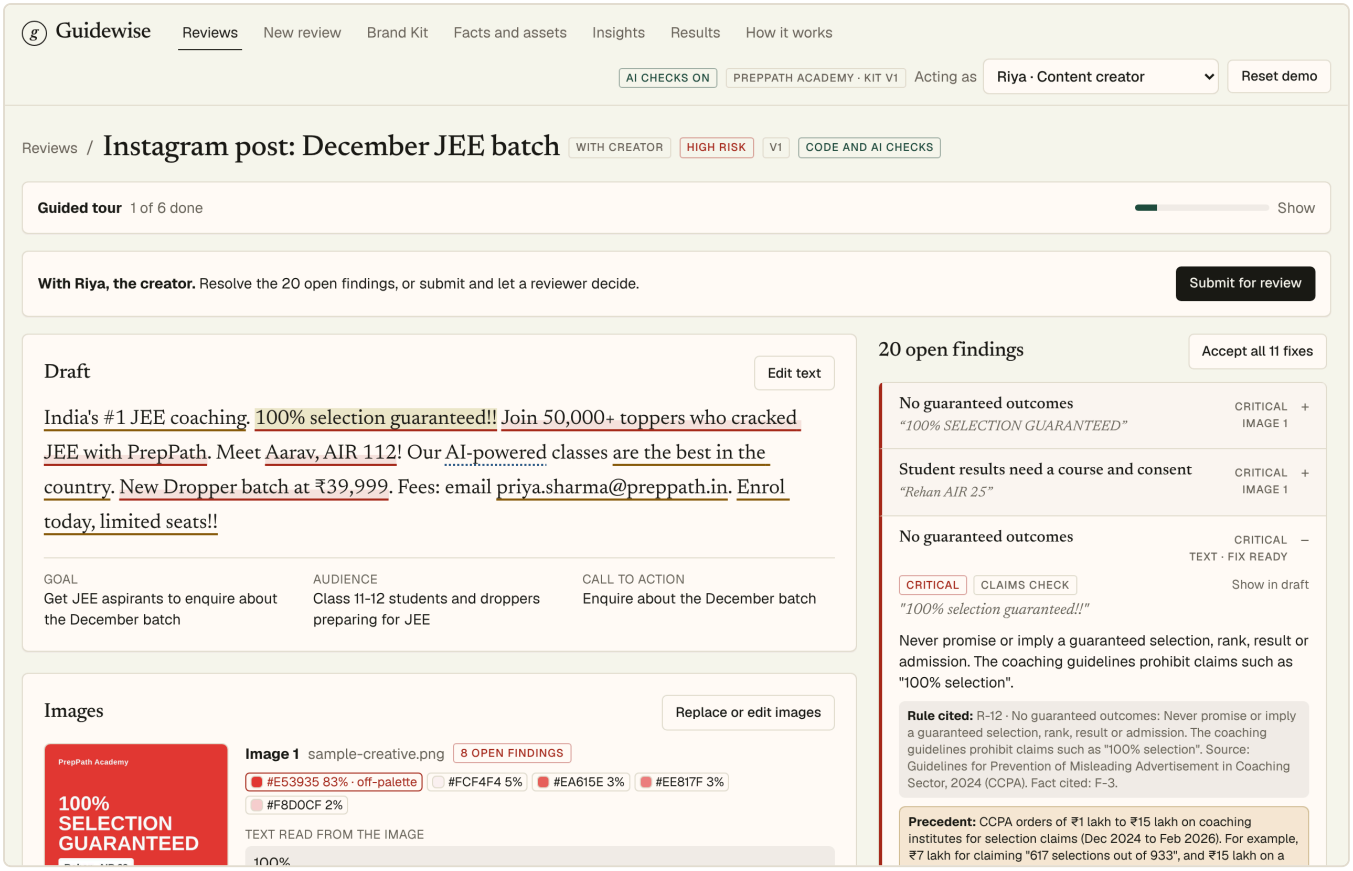

| | |
|---|---|
| Live product | **https://guidewise-kohl.vercel.app** · no sign-in; each visitor gets a private demo workspace |
| Source code | https://github.com/mahak867/Guide-wise |
| Demo brand | PrepPath Academy, a fictional JEE/NEET coaching brand written by the team |
| Team | Mahak Fahad (team leader, Backend + AI/ML) · Roshini R (Frontend + Design/UI-UX) · Chennai Institute of Technology |

## Where Round 2 stands

The central workflow runs end to end.
Paste copy or upload a DOCX, PDF or images → cited findings with re-tested fixes → accept, edit or dismiss with a reason → a fixed rule table routes to the brand or compliance reviewer → approval with a fingerprinted record. Tested end to end on the live site with the AI checks on.

Measured, not claimed.
On 40 held-out drafts with planted errors, code checks alone reach 100% precision and 74% recall; with the AI checks, 96% precision and 100% recall. 46 automated tests and CI run on every push.

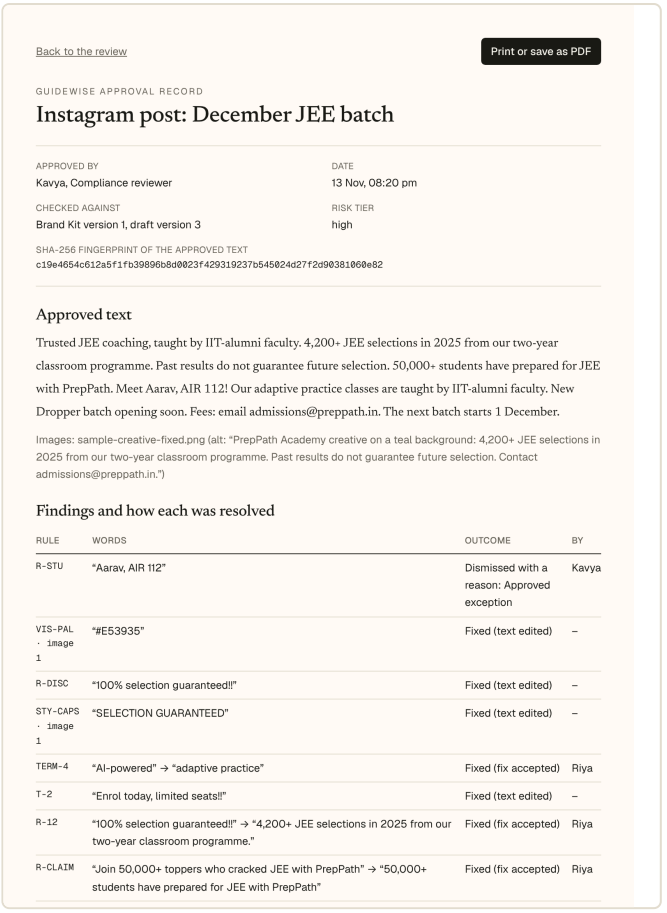

# The product

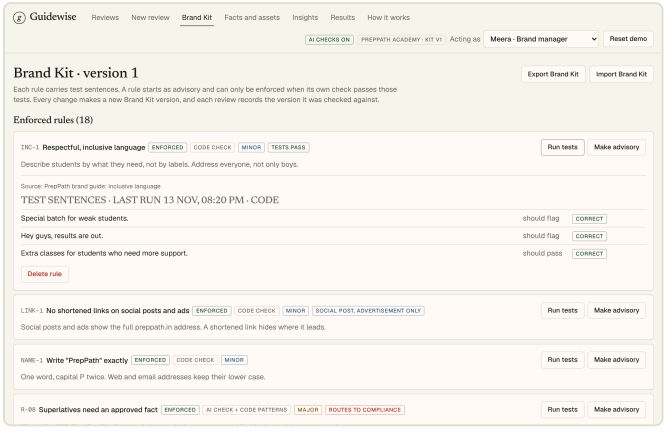

The sample Instagram post: the draft set as a manuscript with findings underlined, and one finding open with its rule, source, precedent and re-tested fix.

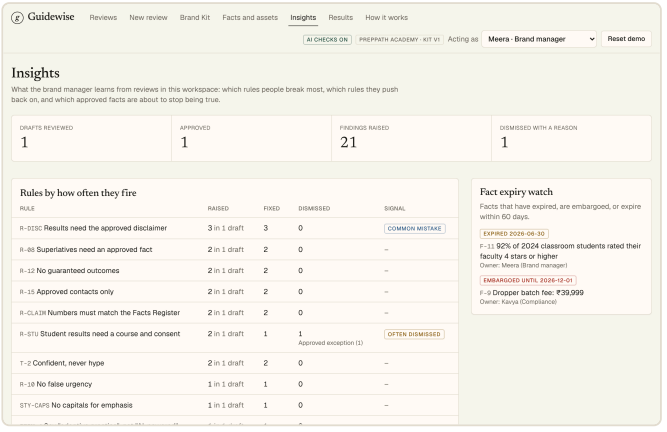

Text read from the creative is checked against every rule and fact; colours are checked against the palette.

Approval: the SHA-256 fingerprint of the exact approved text, the Brand Kit version, and every finding with how it was resolved.

Brand Kit: each rule carries test sentences and can only be enforced when its own check passes them.

Insights: which rules fire most, which are dismissed and why, and facts about to expire.

# Completed features

| AREA | WHAT A JUDGE CAN DO WITH IT |
|---|---|
| Review | Paste copy, or upload DOCX, PDF and up to four images; state goal, audience, call to action and locked phrases no fix may remove. |

| | |
|---|---|
| Code checks | Preferred terms, banned phrases, approved contacts, student results (course and consent record), the results disclaimer (with a same-language check for Hindi claims), and every figure against the Facts Register. |
| AI checks | Claims and voice rules judged one rule per call, run twice when they find something; disagreement becomes a suggestion. Groq, then Gemini, with a 20-second cap per call; the app keeps working in rules-only mode if both are down. |
| Verifier | Plain code drops any finding whose quoted words, rule or fact does not exist ("no source, no flag"). |
| Images | OCR in the browser (served from our own site), palette check in CIELAB, WCAG contrast, alt text; image text runs through every rule and fact. Logo check: the Brand Kit logo is searched for at many sizes (masked normalised cross-correlation, no AI), then checked for minimum size and clear space. |
| Writing style | Code rule types for exact brand-name spelling, capitals used for emphasis, maximum length per content type (ad text cut off at "See more"), maximum sentence length, and inclusive wording, each with a fix where one is safe. |
| Facts Register | Facts with evidence, owner, valid-from, valid-until and required disclosure; embargoed, expired and wrong-subject figures are each flagged. |
| Fixes | Each fix is applied and re-checked before it is offered; AI-written fixes may not introduce any violation; edit a fix before accepting; "Accept all" works through follow-ups. |
| Brand Kit | Rules with test sentences, an enforce gate, versioning, and a guide compiler that drops any proposed rule whose quoted passage is not in the guide. |
| Regulation pack | CCPA coaching guidelines (2024) with a real penalty order shown on each regulation finding, and the "more than 50 students" applicability gate. |
| Workflow | Four roles enforced on the server; risk routing by a fixed rule table; comments, version history with word-level diffs, activity log, approval record (save as PDF). |
| Insights | Most-flagged rules, dismissal reasons, rules two or more people call unclear, fact expiry watch. |
| Privacy | Emails, phone numbers, Aadhaar, PAN and card numbers are masked in code before any AI call. A draft marked confidential is never sent to AI at all. |
| Channels | A rule can apply to some content types only (for example, no shortened links on social posts and ads); the brief card shows the rules for the type being written. |
| Portability | The Brand Kit exports and imports as one JSON file; imported new or changed rules arrive as advisory until they pass their tests. |
| Reliability | AI answers are cached by rule and text, so many judges reviewing the same sample spend no extra quota; a 20-second cap on every AI call; a 20-step browser test of the whole journey runs against the live site. |
| Usability | One-click sample post, a guided tour that ticks itself off, private workspace per visitor, works on a phone. |

## How it is built

**1 Redact** | **2 Code checks** | **3 AI checks** | **4 Verifier** | **5 Re-test fixes** | **6 Route**

| | | | | | |
|---|---|---|---|---|---|
| Personal data out before any AI call | Terms, contacts, students, every figure vs the register | One rule per call, run twice | Quote, rule and fact must exist | New issue → fix withdrawn | Fixed rule table, human approves |

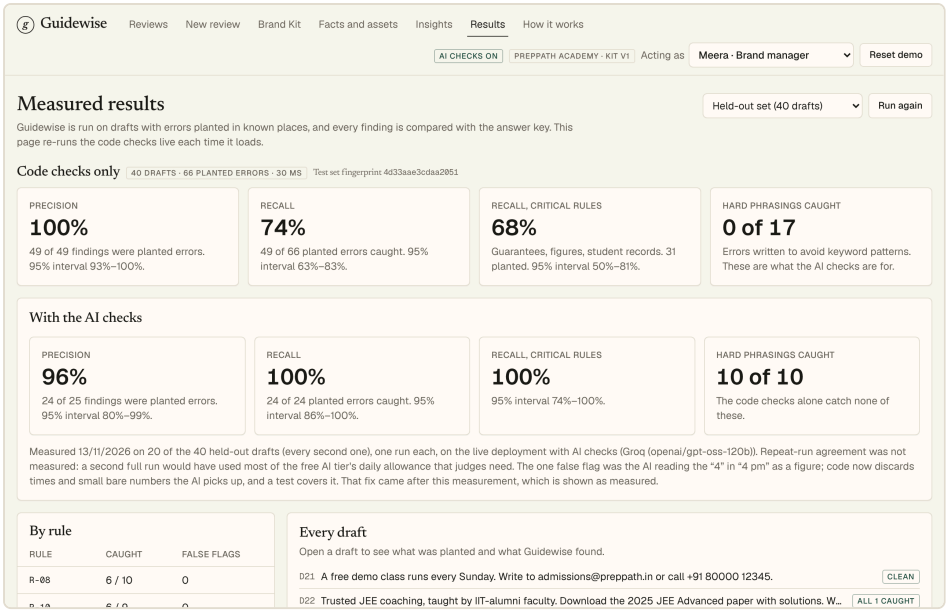

Only step 3 uses AI. The AI only locates number claims; code re-reads each value and compares it with the Facts Register.

| LAYER | CHOICE AND REASON |
|---|---|
| App and API | Next.js 16 (TypeScript), React 19, Tailwind CSS 4 on Vercel, functions in Mumbai next to the database. One codebase, one language for a team of two. |
| Data | Supabase Postgres; every table scoped by a workspace ID so each visitor's demo is isolated. |
| AI | One adapter for Groq (openai/gpt-oss-120b), Gemini and Claude with automatic fallback; every answer must pass a Zod schema. |
| Documents and images | mammoth (DOCX), unpdf (PDF), tesseract.js (OCR) — read in memory, never stored. |
| Quality | 46 Vitest tests, including six that swap in a deliberately wrong AI (invented quotes, forbidden fixes, wrong numbers, prompt injection, personal data); CI runs lint, type-check, tests, evaluation and build on every push. |

## Measured results

60 short drafts for PrepPath with errors planted in known places (20 used while building, **40 held out**). A finding counts as correct when it cites the planted error's rule and quotes overlapping words; anything else is a false flag. Intervals are 95% Wilson intervals. Test-set fingerprint `4d33aae3cdaa2051`.

| HELD-OUT SET | PRECISION | RECALL | CRITICAL RECALL | HARD PHRASINGS | REPEAT-RUN AGREEMENT |
|---|---|---|---|---|---|
| Code checks only (40 drafts) | 100% (93%–100%) | 74% (63%–83%) | 68% | 0 of 17 | 100% (deterministic) |
| Code and AI checks (20 drafts) | 96% (80%–99%) | 100% (86%–100%) | 100% | 10 of 10 | not measured |

The live Results page: the code checks re-run on every visit; the AI checks were measured on the live site.

The AI row is measured on 20 of the 40 held-out drafts (every second one), one run each, on the live site; repeat-run agreement was not measured because a second run would have used most of the free AI tier's daily allowance. Its one false flag (a time, "4 pm", read as a figure) was fixed afterwards and is covered by a test.

These numbers are optimistic: the team wrote both the rules and the test drafts. "Hard" errors were written on purpose to avoid keyword patterns. The next step is real, anonymised drafts from coaching-centre marketers.

## Changes from the Round 1 plan

| PLAN | WHAT WE DID | WHY |
|---|---|---|
| Supabase Auth with four roles | No sign-in; a private workspace per visitor and a role switcher, role rules enforced on the server | The Round 2 brief requires judges to use the link without signing in. |
| Image review in Round 3 | A first version ships now (palette, contrast, alt text, logo presence, size and clear space, OCR text through every rule) | The brief names visual identity as part of the central workflow. Round 3 deepens it. |
| AI on Claude | One adapter: Groq, then Gemini, Claude when a key is set | Free tiers make the AI checks available to judges at no cost; the schema and verifier are the same for all. |
| Fixes withdrawn on any new issue | Withdrawn only when the new issue has no automatic fix (AI-written fixes: any new issue) | Fixing a guarantee correctly raises a disclaimer requirement; withdrawing that fix was wrong. |
| alex, write-good, axe-core | Replaced by our own code rules: brand-name spelling, capitals, length, sentence length, inclusive wording; contrast and alt text for images | As Brand Kit rules they carry test sentences, can be edited by the manager and cite their source, which the libraries' fixed word lists could not. |
| Hands-on tests with students | Moved to the start of Round 3 | Build time went into image review and the measured evaluation. |

**Correction to Round 1.** The Round 1 PDF stated CCPA maximum penalties of "up to ₹10 lakh / ₹50 lakh" on pages 2 and 14. We could not confirm these amounts against the Act and withdraw them. The penalty orders shown in the product are cited as reported in the linked press coverage.

## The three major improvements for Round 3

### 1. Guideline Health loop — the brand guide fixes itself

Round 2 already flags rules that two or more people dismiss as unclear. Round 3 closes the loop: Guidewise drafts an amendment with new test sentences, the manager approves it, and a new Brand Kit version must pass its tests. Changing a fact lists every draft and approved piece that used it.

Test: dismiss one rule as three different creators → it is marked unclear with a drafted amendment that passes its tests; change a fact → every affected piece is listed.

### 2. Governance at the source — an API and MCP server for AI writing tools

A REST API with scoped keys and an MCP server exposing `get_brief` and `check_draft`, so AI writing tools fetch the rules and the facts valid today and check a draft before handing it over. An in-app playground and a per-key audit trail.

Test: call `check_draft` from the playground and from an MCP client with a key → the same cited findings as the app, and a new audit entry.

### 3. Campaign and creative review with AI vision

Review a whole campaign together (caption, creatives, landing-page copy, PDF brochure) and flag inconsistencies across assets: prices, dates, claims, promo codes. AI vision checks what OCR cannot see: a student photo with no consent record, a recoloured or redrawn logo, stylised claims.

Test: upload a three-asset campaign with a price mismatch and an unconsented student photo → both found, cited and routed to compliance.

## Team and disclosures

| MEMBER | ROLE | COLLEGE | COURSE |
|---|---|---|---|
| Mahak Fahad (team leader) | Backend + AI / ML | Chennai Institute of Technology | B.E. Computer Science and Engineering, batch of 2029 |
| Roshini R | Frontend + Design / UI-UX | Chennai Institute of Technology | B.E. Computer Science and Engineering, batch of 2029 |

- **AI used in building:** Claude (Anthropic) was used to help write code and documents during the official build window. The team reviewed it and is responsible for it.
- **AI in the product:** Groq and Gemini APIs (Claude supported), through one adapter. Personal data is masked before any call.
- **Reused code or templates:** none, apart from the Next.js starter (create-next-app). All product code was written inside the build window; the commit history starts on 13 November 2026 at 10:09 IST.
- **Open source:** Next.js, React, Tailwind CSS, supabase-js, Zod, Anthropic SDK, groq-sdk, @google/genai, mammoth, unpdf, tesseract.js.
- **Demo data:** PrepPath Academy, its rules, facts and students are fictional. Penalty orders are cited as reported in the linked press coverage; we have not read the orders themselves. Guidewise supports reviewers; it does not give legal advice.
